

## Faculty of Technology and Engineering

### U & P U. Patel Department of Computer Engineering

Date : 10 /06/2023

#### Practical List

Academic Year	:	2023-24	Semester	:	5 <sup>th</sup>
Course code	:	CE382	Course name	:	Advanced Web Technology

Sr. No.	Aim	CO
1.	Create a program that declares and initializes variables of different data types (string, number, boolean) and displays their values. Write a function that takes two numbers as parameters and returns their sum.	1
2.	Create an array of numbers and perform the following operations: => Find the length of the array. => Access and display specific elements using indexing. => Use array methods like push(), pop(), shift(), unshift(), join(), delete(), concat(), flat(), splice() and slice() to modify the array. Create an object representing a person with properties like name, age, and gender. Implement a function that displays the person's details.	1
3.	Implement following features of ECMASCRIPT 6. <ul style="list-style-type: none"> <li>The let keyword</li> <li>The const keyword</li> <li>Arrow Functions</li> <li>The (Spread Of) ... Operator</li> <li>For/of</li> <li>Map Objects</li> <li>Set Objects</li> <li>Classes</li> <li>Promises</li> <li>Symbol</li> <li>Default Parameters</li> <li>Function Rest Parameter</li> </ul>	1
4.	Write a function that calculates the factorial of a given number using recursion. Create a nested function that performs a specific task and invoke it within another function.  (NOTE: Implement the concept of variable scope in functions by declaring variables with different scopes (global, local) and accessing them).	1
5.	Define a class representing a vehicle with properties like make, model, and year. Implement methods to display the vehicle details and calculate the mileage.	1

	Create child classes like Car and Motorcycle that inherit from the Vehicle class and add specific properties and methods.	
6.	Use the prototype property to add a new method to an existing object constructor, such as Array or String.	1
7.	Create a JavaScript module that exports a class representing a calculator with methods to perform basic arithmetic operations. Import the module in another JavaScript file and use the calculator class to perform calculations.	1
8.	<p>Create a JavaScript module that fetches data from an API using the fetch() function and exports the retrieved data.</p> <p>Create an async function getUsers(names), that gets an array of GitHub logins, fetches the users from GitHub and returns an array of GitHub users.</p> <p>The GitHub url with user information for the given USERNAME is: https://api.github.com/users/USERNAME.</p> <p>There's a test example in the sandbox.</p> <p>Important details:</p> <ul style="list-style-type: none"> <li>• There should be one fetch request per user.</li> <li>• Requests shouldn't wait for each other. So that the data arrives as soon as possible.</li> <li>• If any request fails, or if there's no such user, the function should return null in the resulting array.</li> </ul>	1
9.	Implement dynamic imports using the import() function to load modules asynchronously based on certain conditions.	1
10.	Create an iterator that generates an infinite sequence of numbers and a generator that yields a sequence of even numbers. Use the iterator and generator in different scenarios.	1
11.	Write a program that demonstrates asynchronous behavior using a callback function. For example, create a function that simulates fetching data from an API and invokes a callback with the fetched data.	1
12.	Create a program that reads a file asynchronously using callbacks and displays its contents.	1
13.	<p>Write a program that uses Promises to handle asynchronous operations. For example, create a function that returns a Promise to fetch data from an API and resolve it with the fetched data.</p> <p>Implement error handling using Promises by rejecting a Promise with an error message in case of failure.</p>	1
14.	<p>Convert a Promise-based asynchronous function into an async/await style function. For example, rewrite a function that fetches data from an API using async/await.</p> <p>Write a program that utilizes multiple async/await functions to fetch data from different APIs sequentially and display the combined results.</p>	1
15.	<p>Create Secure Server using Nodejs and ExpressJs.</p> <p>Note: Explore nodemon package to handle server automatically</p>	2
16.	<p>Create Login and Registration using ExpressJs.</p> <p>Note:</p>	2,3

	<ul style="list-style-type: none"> <li>• Apply Session, Cookies and JWT Token Concept.</li> <li>• Apply Passport.js for Authentication middleware</li> </ul>	
17.	<p>Create Course page which contains University Name, Institute Name, Department Name, CourseName, CourseCode, Semester. Handle.</p> <p>Note:</p> <ul style="list-style-type: none"> <li>• Create Middleware to Sanitize and validate All fields</li> </ul>	4,5
18.	<p>Create Email sending Page which contains To, From, CC, BCC, Subject and Message body field.</p> <p>Note:</p> <ul style="list-style-type: none"> <li>• Explore How send email with attachments</li> <li>• Create and apply email template before sending email</li> </ul>	4,5
19.	<p>Create a page which ask user to upload/Download the files.</p> <p>Note: Explore Multer Package</p>	5
20.	Create CRUD Operation page using ExpressJs, MongoDB and Sequelize ORM Framework	4,5,6
